

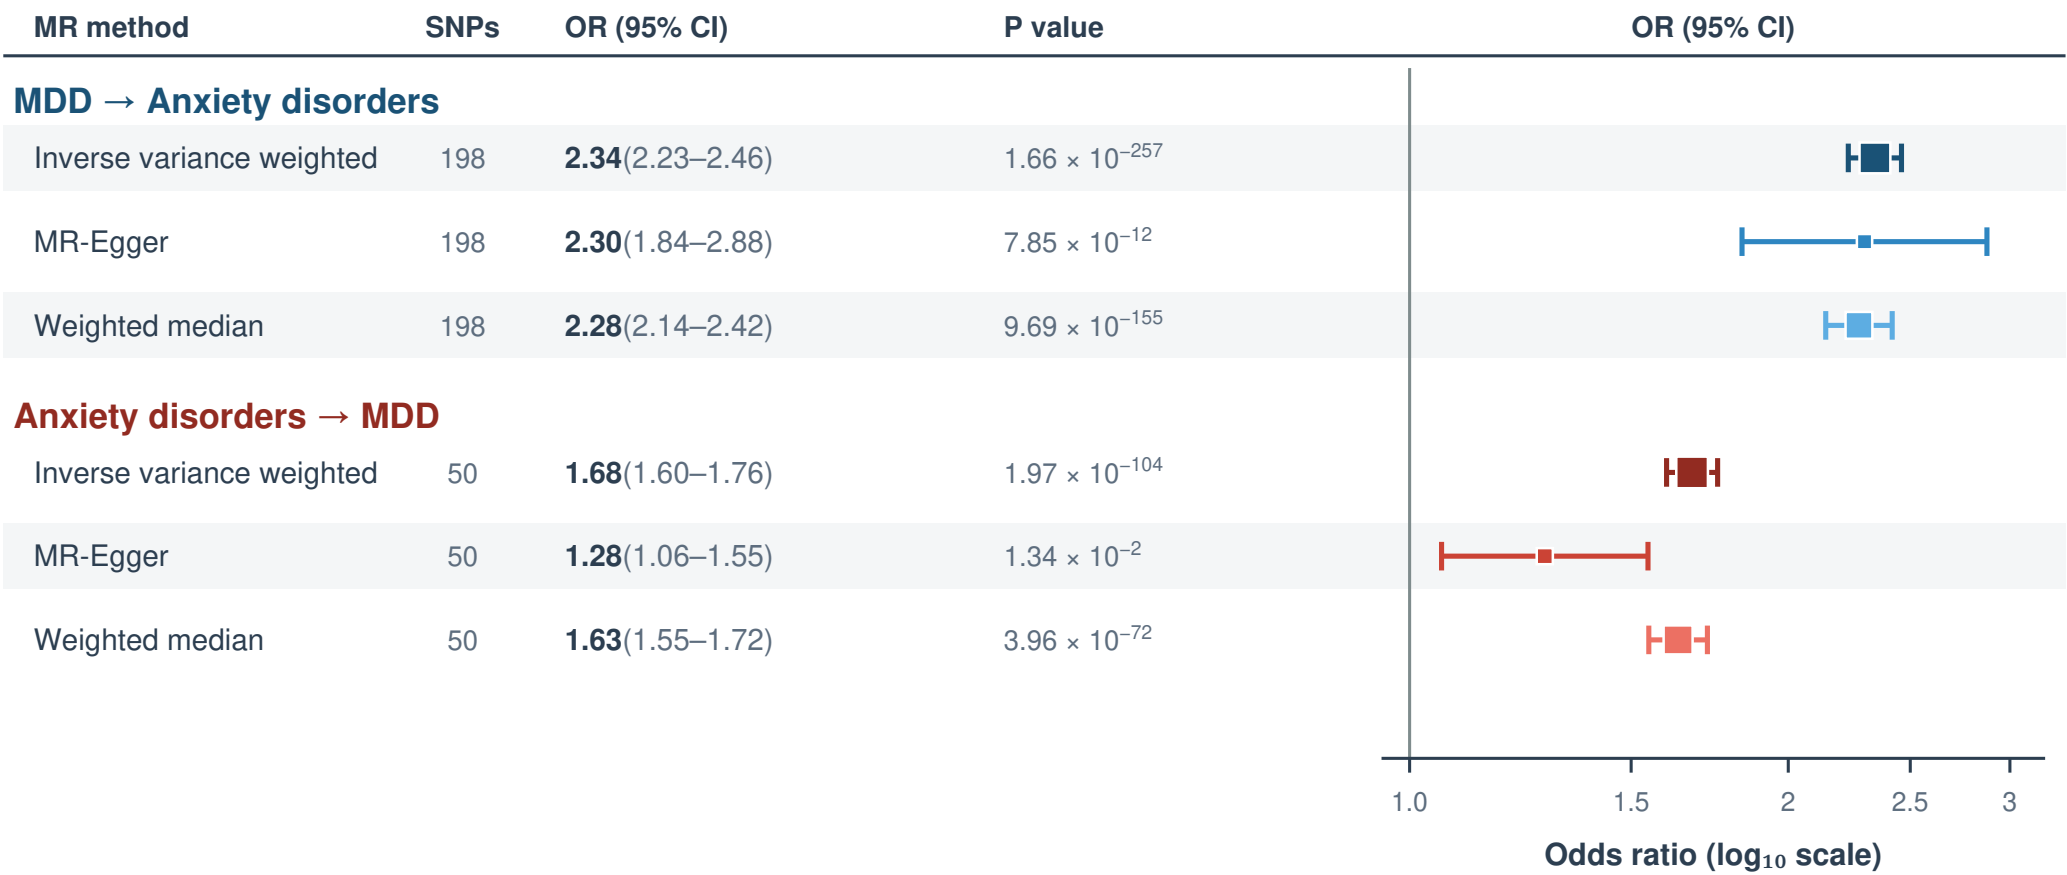

Figure 2

Forest plot of bidirectional Mendelian randomization estimates
between major depressive disorder and anxiety disorders

Estimates are per one log-odds increase in genetically predicted liability to the exposure. Instruments were clumped against the 1000 Genomes European reference panel. Box area is proportional to the inverse-variance weight (1/SE²); horizontal bars denote 95% confidence intervals. The dashed vertical line marks the null (OR = 1). MDD, major depressive disorder; OR, odds ratio; CI, confidence interval; SNP, single-nucleotide polymorphism.
