

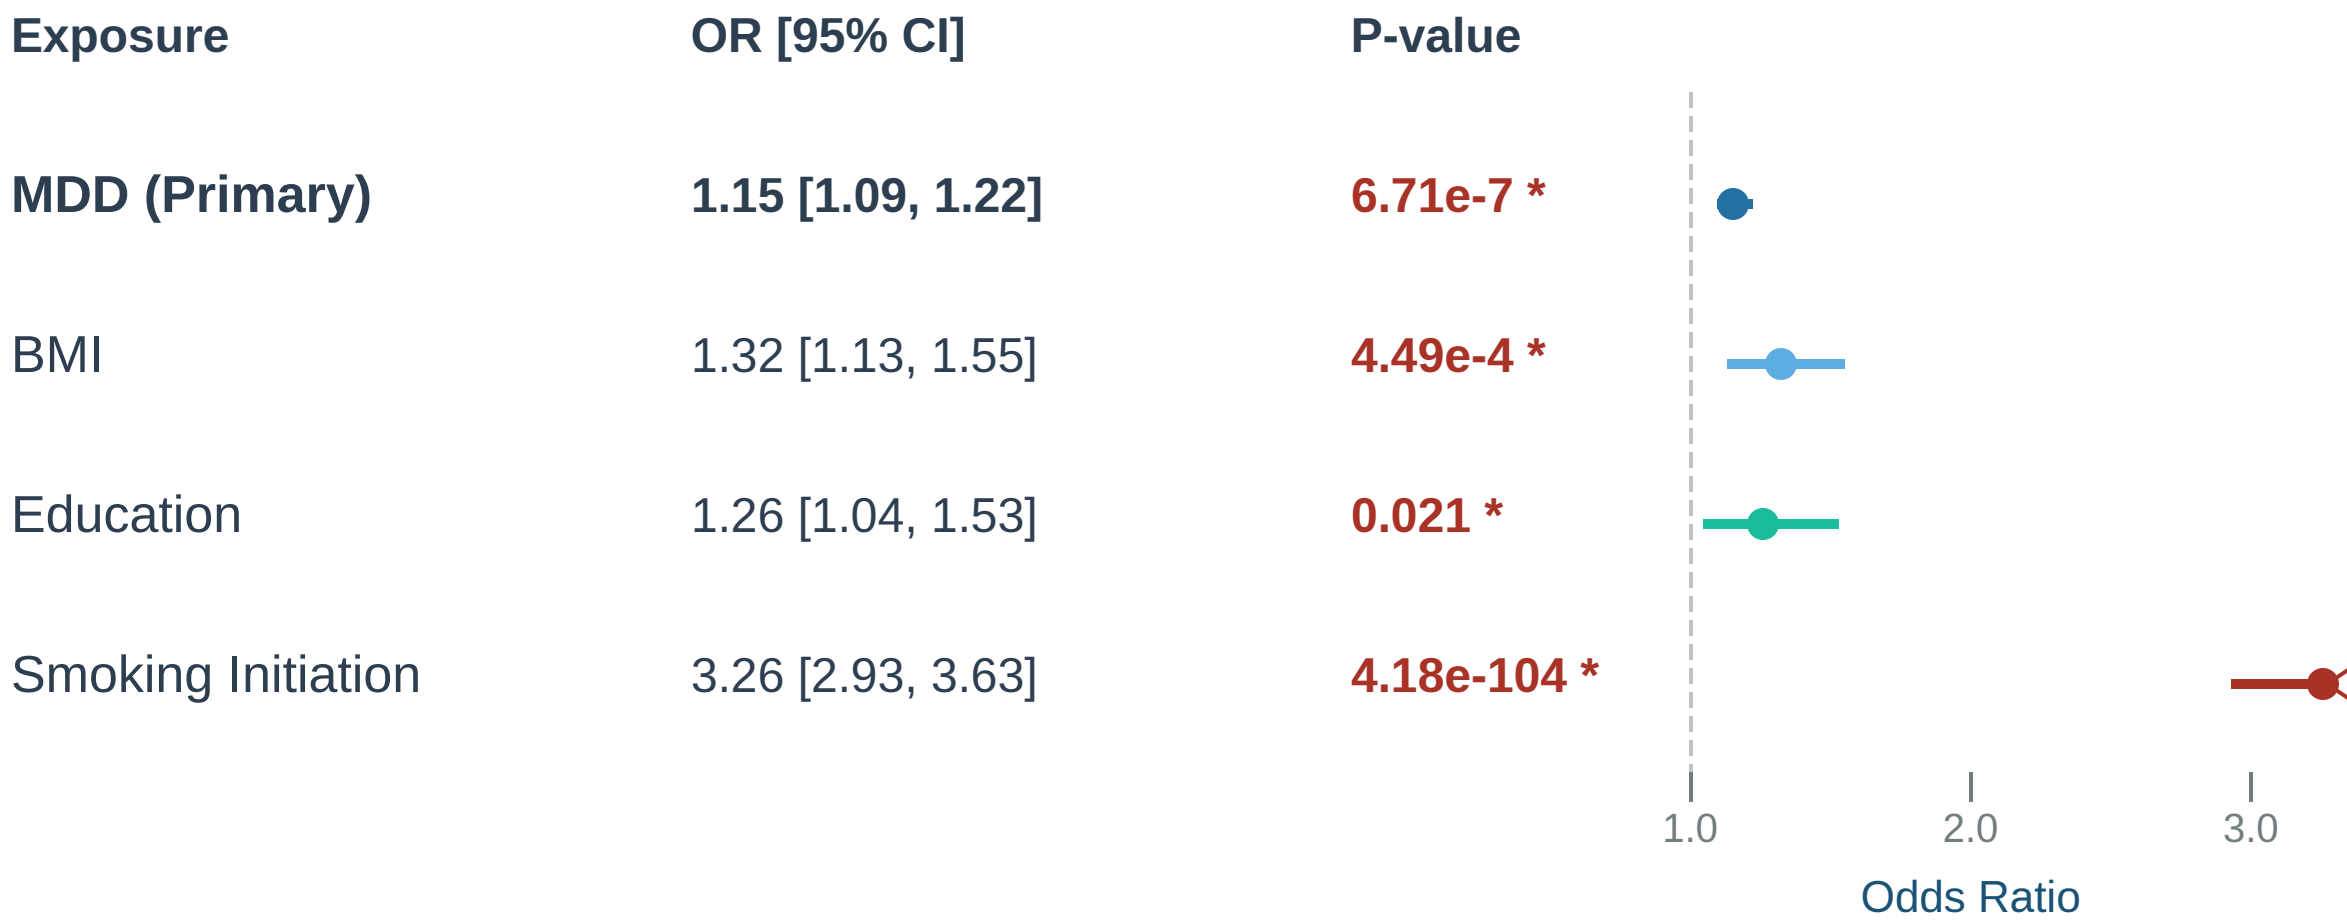

Figure 3

Multivariable MR estimates adjusted for BMI, education, and smoking initiation

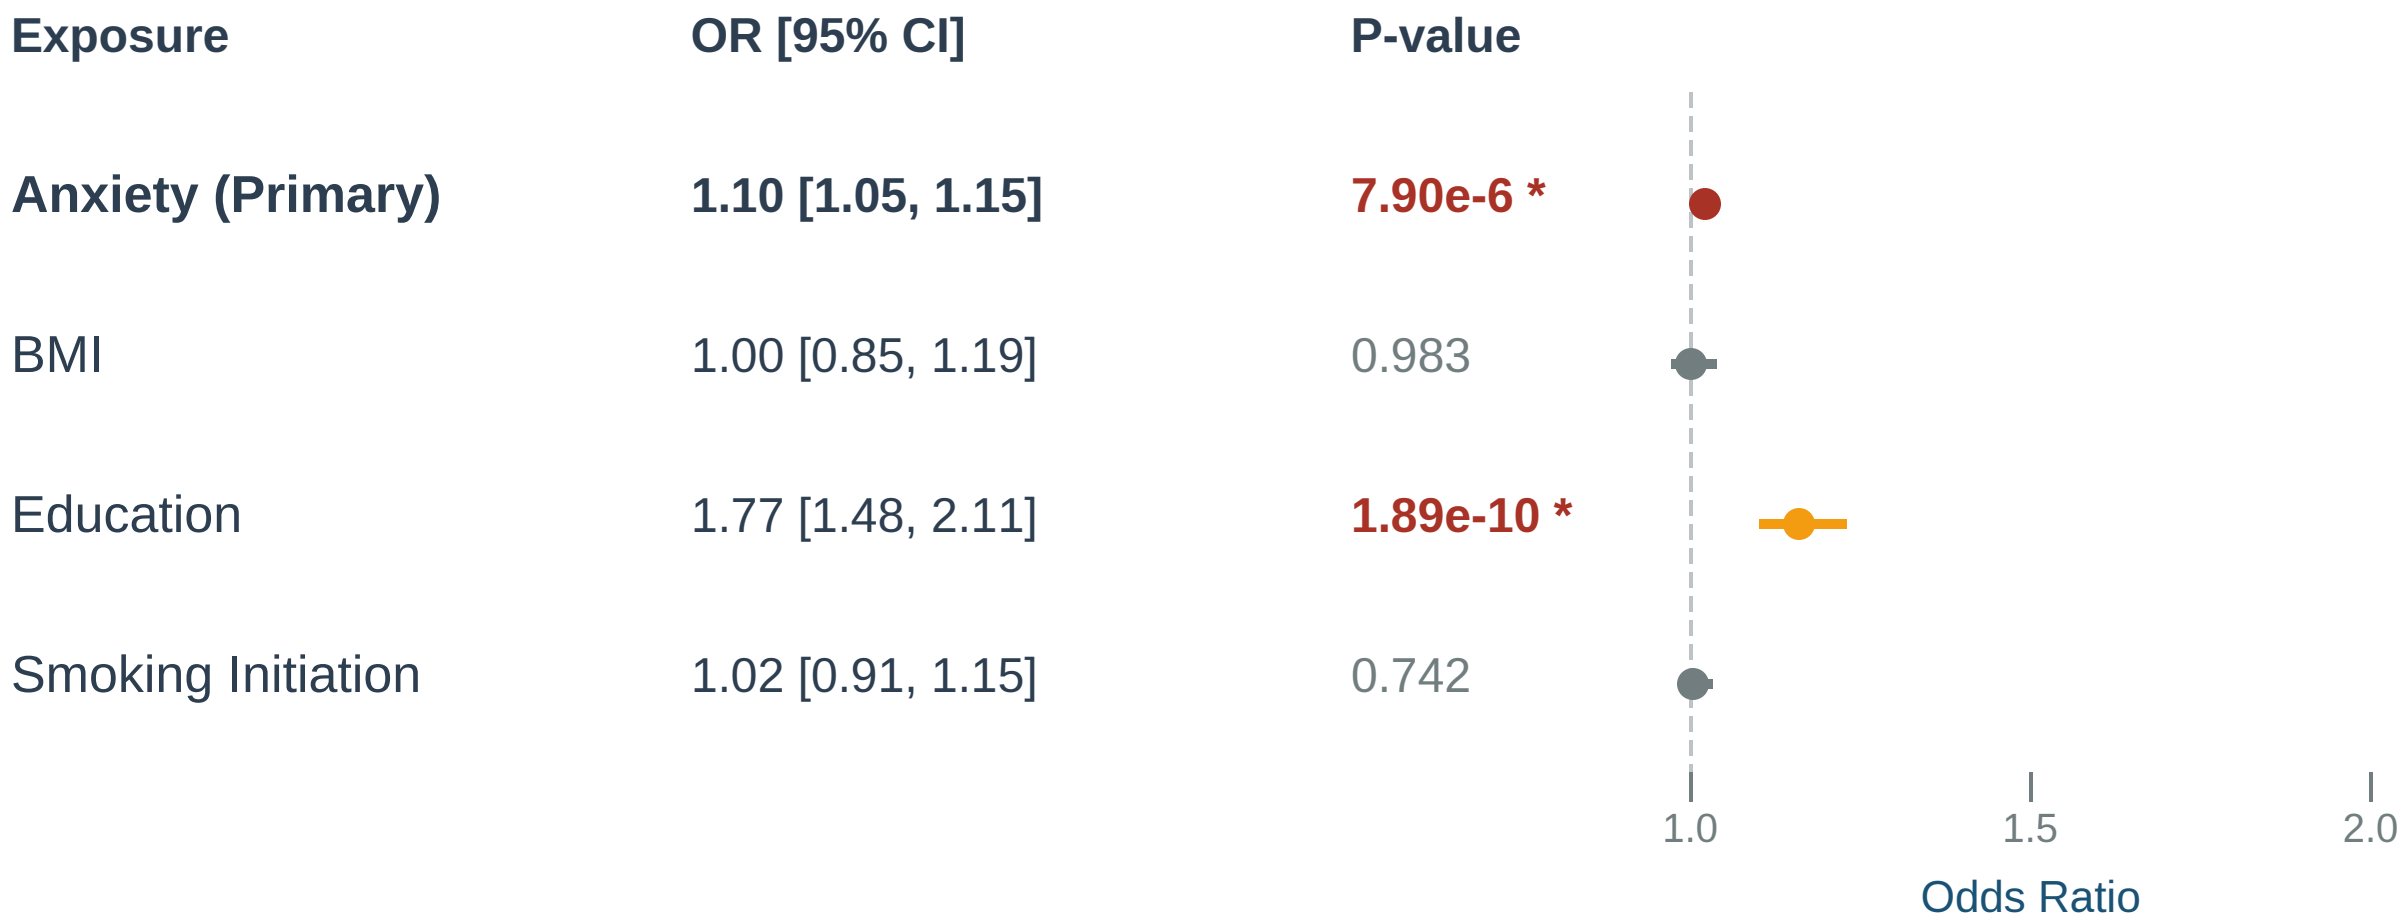

Panel A: MDD → Anxiety

Conditional F = 24.7

Panel B: Anxiety → MDD

Conditional F = 20.0

Legend:

● MDD primary

● Anxiety primary

● BMI

● Education

● Education (B)

● Non-significant

* $P < 0.05$. Dashed line = $OR = 1$ (null hypothesis). CI = confidence interval.
MVMR estimates are exploratory sensitivity analyses; conditional F-statistics indicate adequate instrument strength.

Key Finding:
After adjusting for BMI, education, and smoking, MDD → Anxiety OR attenuated from 2.34 to 1.15, and Anxiety → MDD from 1.68 to 1.10, but both remained statistically significant — supporting partially independent causal pathways.
